ADCOM GFP-750 Specifications

Output Level (Rated) 1.0V

THD+N @ Rated Output (20Hz to 20kHz)

Balanced $\leq 0.025\%$
Unbalanced $\leq 0.095\%$

THD+N @ Rated Output (1kHz)

Balanced $\leq 0.015\%$
Unbalanced $\leq 0.017\%$

Output Impedance

Balanced $< 1200\Omega$
Unbalanced $< 600\Omega$

Input Impedance

Balanced $94k\Omega$
Unbalanced $47k\Omega$

Frequency Response (Balanced and Unbalanced)

20Hz to 20kHz $+0, -0.25dB$

IM Distortions (@ Rated Output)

CCIF from 4kHz to 20kHz (Balanced) $\leq 0.009\%$
CCIF from 4kHz to 20kHz (Unbalanced) $\leq 0.035\%$
SMPTE (Balanced) $\leq 0.05\%$
SMPTE (Unbalanced) $\leq 0.05\%$

Signal to Noise Ratio (Ref. To 1 volt)

"A" Weighted (Balanced) $\geq 102dB$
"A" Weighted (Unbalanced) $\geq 102dB$

Input Sensitivity (@ Rated Output)

Balanced $183mV$
Unbalanced $365mV$

GENERAL SPECIFICATIONS

Power (available in 230V by special order) 115VAC-50/60Hz
Power Consumption 30VA
Chassis Dimensions 3 1/2" (89mm) x 17" (432mm) x 11" (279mm)
Maximum Dimensions 4 1/8" (105mm) x 17" (432mm) x 12" (305mm)
Weight 15lbs. (6.8kg)
Weight, Packed 17 lbs. (7.7kg)

H = high level, L = low level
 Q₀ = level of output before steady-state input conditions were established
 Z = high impedance
 X = don't care

ADCOM GFP-750 Circuit Description

Power Supply

The power supply consists of two supplies each connected to a separate secondary winding of transformer T1. The first, a +12V unregulated supply, is formed by D41-D43 and filter capacitor C40 and is used to power the various relay coils. From this a regulated 5V line is derived by Q39, C46 and choke L45, L47 to run the control circuitry of U53, U68, volume and balance motor drives and front panel LEDs.

The second supply is formed by rectifier diodes D19-D22, capacitor C23 and the regulator circuit of Q28. This +60V supply is distributed to the preamp circuit of both channels.

Signal Path

The selected signal source is switched to the preamplifier circuit through a bank of relays controlled by U53. Only the CD source has an option for balanced input operation. **If the CD input is operated with an unbalanced source, external jumpers must be placed in XLR jacks J165 and J175 to connect pins 1 and 3. The GFP-750 is shipped with these jumpers in place (part # 22001445). This shorts**

the RIN- and LIN- lines to signal ground. For all other sources, RIN- and LIN- are connected to signal ground via K161 and K178. TAPE input mode connects the tape inputs to RIN+ and LIN+ through K144 to the preamp circuit AND disconnects tape out jacks J132A and J132B. MONO relay K166 AC couples the RIN+ and LIN+ lines together through C163 and C164 for mono operation.

The discrete preamplifier circuit is the same for both left and right channels. Unbalanced operation of the left channel is described here. Reference numbers are different for the right channel. O188 and Q228 are constant current sources regulated by transistors O194 and O234 respectively. Q209 and Q249 are constant current sinks regulated by O206 and Q246 respectively. Q196 and Q236 operate as a differential pair at audio frequencies. The LIN+ signal is AC coupled to O196 gate through C191 and C192. The LIN- signal (which is shorted to signal ground for unbalanced sources) is AC coupled to Q236 gate through C232 and C231. The signal voltage variation at O196 gate modulates the drain current of Q196 directly and the drain current of O236 indirectly via R210, C211, C212 and balance pot R330B. The produced variations cause similar current variations through drain resistors R202 and R242 producing the output voltage signals at the drains of O196 and O236. The two signals are equal amplitude and opposite polarity. These output signals are AC coupled through capacitors C199, C189, C239 and C229 to the output jacks J108, J106 and J115A-D for either balanced or unbalanced output (regardless of input mode). Relays K114 and K109 determine the output mode (STEREO, REVERSE).

In passive mode LIN+ and LIN- are diverted around the preamp circuit by K118, K131, K135 and K168. Only volume pot R331 remains in the signal path. PROCESSOR relays K136 and K126 divert the LIN+ signal through the PROCESSOR jacks J123D out and J123B in to the LOUT+ output. MUTE relays K122 and K112 short the LOUT+ and LOUT- signals to ground at the volume pot wiper.

Control Circuitry

Microcontroller U53 performs most of the state switching of the GFP-750. Its operating frequency is set by X54, C55 and C56 to 12MHz. Port 1 of U53 (pins 13 – 20) is used as both an input and output. The input pins receive the remote control signal, monitor the PWER switch, S419, the PROCESSOR switch, S422, and the SOURCE rotary encoder, S412. The output pins control the balance pot motor and U68 latch enable.

U53 Port 3 (pins 1-5 and 21-23) outputs a parallel 8-bit control word. This 8-bit word is latched through U68 from input pins 2 – 9 to output pins 12 – 19. This latched word controls the 8 relay drive transistors for the CD, TUNER, AUX 1, AUX 2, TAPE, POWER, MUTE and PROCESSOR sources. When the user changes sources a new 8-bit word is produced at U53 Port 3 and latched through U68 to change the state of the relays. The latching of the word is marked by a momentary 5V pulse on U68 pin 11.

U53 Port 0 (pins 6-8) controls the volume motor.

The U53 reset pin (pin 9) time constant is set by C50 and R1. Pin 9 will be pulled high momentarily at power up when back panel switch S3 is switched on.

Remote control signals are received either through J95 and O62 or IR receiver IR370. These signals are sent to U53 via buffer/amplifier O63.

The REVERSE and MONO relay circuits, O84, K109, K114, O82 and K166, are driven directly by MODE switch S401. PASSIVE mode relays K118, K131, K135 and K168 are driven directly by S416.

U359 and transistors O350, O351, O354, O355, O364, O365, O368 and O369 drive the balance and volume motors.

ADCOM GFP-750 Voltage Conversion

Converting from 120V to 240V operation

1. Disconnect the AC cord and remove the top cover
2. Move the blue secondary wire from P7 to P14 and move the white secondary wire from P6 to P13 - see figure 1 below.
3. Change fuse F2 to 1A/250V SLB.
4. Change fuse F11 to 250mA/250V SLB.
5. Remove fuse F12.
6. Remove the rear panel mounted "switched AC-outlet" jack (J8 on schematic) and the black and red connecting leads from the jack to P15 and P8 on the circuit board. Cover the chassis hole with rubber blocking plate (ADCOM part #:25001002).

Figure 1: Main transformer connections and fuse values for 240V operation.

Converting from 240V to 120V operation

1. Disconnect the AC cord and remove the top cover
2. Move the blue secondary wire from P14 to P7 and move the white secondary wire from P13 to P6 - see figure 2 below.
3. Change fuse F2 to 2A/250V SLB.
4. Change fuse F11 to 500mA/250V SLB.
5. Change fuse F12 to 1A/250V SLB.
6. (Optional) The GFP-750 240V version does not have a rear panel mounted "switched AC-outlet" jack. The position for this jack, at the top right hand side of the rear panel, has been blocked with a rubber plate on 240V versions. To add the "switched AC-outlet" you will need the female AC jack (ADCOM part #:25000750) and connecting wire set (ADCOM part #:48000075). Remove the rubber block and mount the AC-jack to the rear panel. Connect the black wire from P15 on the circuit board to the neutral (larger slot) connection of the new switched AC jack. Connect the red wire from P8 on the circuit board to the live (smaller slot) connection on the new switched AC jack.

Figure 2: Main transformer connections and fuse values for 120V operation

ADCOM Service Bulletin

Date: May 29, 1998

Model: GFP-750

Bulletin: GFP-750-1

Complaint: Failed power supply

Some early runs of the GFP-750 used an IRF610 FET as the high voltage supply regulator (Figure 1). In the event that a unit comes in with a failed regulator circuit, it should be updated to the BJT circuit shown in Figure 2.

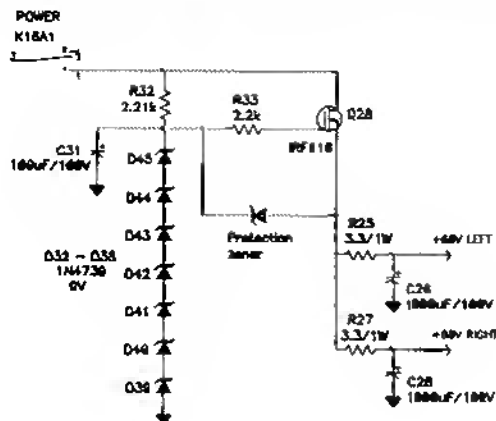

Figure 1

Modification:

1. Add a 1N4004 diode (D30, Adcom part # 16004004) as shown across R31.
2. Change Q28 from an IRF610 to a 2SC4793 (part # 33004793) and remove the protection zener. As shown, the collector goes to the power relay, the base to R30 and the emitter to R24, R26.
3. Change R30 to 221 ohm 1/8W (part # 27004675).
4. Add a 0.1uF/100V cap (C30) from Q28 collector to ground.

Figure 2

ES 5/98
